

A Claim-first evidence path

B Minimum reporting blocks

C Use-case recommendations and minimum evidence

	Resource logic	Minimum evidence
Adsorption ranking	ARC-MOF adsorption/process data; explicit target context; grouped splits; chemistry-observability caveats.	gas/pressure/T/property/unit · joins · top-k stability · trust regime
Process screening	Use process tables only after target definitions and leakage-prone cycle descriptors are documented.	cycle target definition · row retention · duplicate policy · grouped split
Quantum-property prediction	Use QMOF/DFT-consistent resources when electronic-structure consistency is central.	DFT settings · units · failed calculations · chemistry flags
Generative-model training	Use chemistry-validated, duplicate-controlled subsets; keep not-observable cases explicit.	validity filters · duplicate groups · charge/oxidation warnings
Mechanistic interpretation	Prioritize chemically interpretable subsets over maximum resource size.	rule cards · manual-check examples
